## IoT Motion Sensor

In this project, we are going to learn how to make an Internet of things motion sensor which will give us alert on our phone when motion is detected at the place we installed the sensor. Everything works through the internet so there is no limitation of the distance between the sensor and the phone.

## Video

<https://www.youtube.com/watch?v=duoTV5rM7Zc>

## Hardware Used

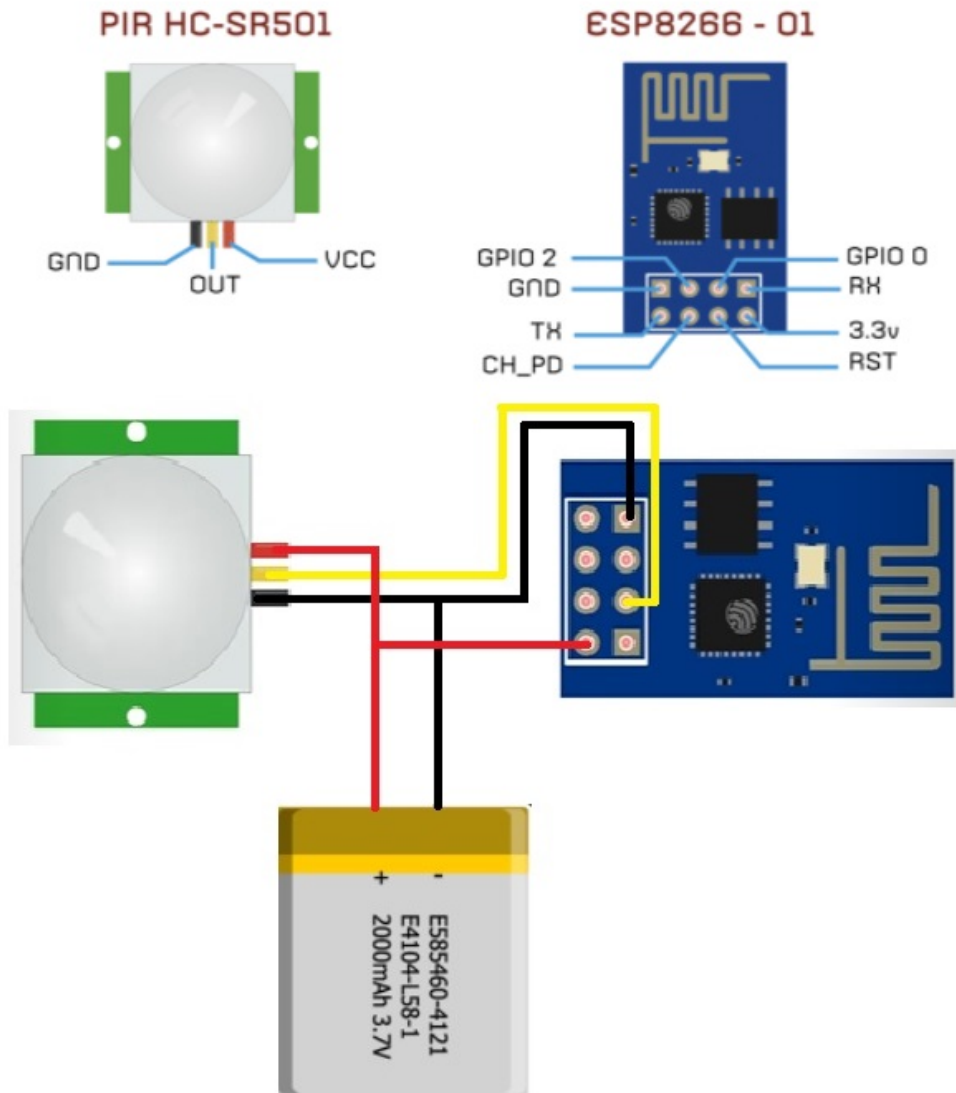

- ESP8266 01
- PIR Motion sensor
- ESP8266 serial adaptor

## Working Theory

- We have connected the PIR motion sensor to one of the GPIO pins of the ESP 8266 – 01.
- Whenever the PIR detects motion then the output states of the PIR sensor will change which will be detected by our ESP 8266 – 01 controller.
- We have programmed the ESP to make an HTTP GET request to our IFTTT webhooks applet.
- Whenever the HTTP GET request has been made then it will trigger a notification alert on our mobile phone.

## Pin Out Diagrams

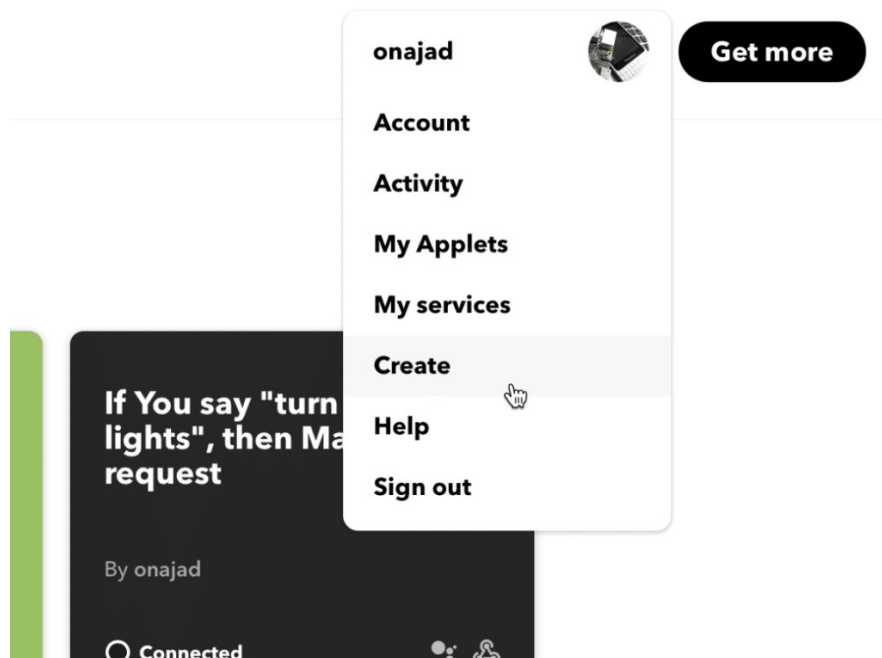

### Wireless PIR Motion Detector Schematic

## IFTTT Applet Creation

- Before creating Applet in IFTTT you need to create an account in the IFTTT web site. [www.ifttt.com](http://www.ifttt.com)
- Also, download the IFTTT app for your Android or iPhone.
- Download the Android app from [here](#).
- Download the iPhone app from [here](#).
- After downloading the app login with your user credentials.
- Also, allow all the permissions which ask for.

Step 1:

- Click on your profile icon
- Then select the create option from the drop-down list.

Step 2:

- Now click on the **+This** button

# If This Then That

Build your own service on the **IFTTT** Platform [↗](#)

Step 3:

## Choose a service

Step 1 of 6

- Now search for **webhooks**
- Then click on the Webhooks icon

Step 4:

- From choose trigger option, click on the “receive a web request.”

[< Back](#)

## Choose trigger

Step 2 of 6

### Receive a web request

This trigger fires every time the Maker service receives a web request to notify it of an event. For information on triggering events, go to your Maker service settings and then the listed URL (web) or tap your username (mobile)

Step 5:

## Complete trigger fields

Step 2 of 6

Event Name

lot\_Motion\_Sensor

The name of the event, like "button\_pressed" or "front\_door\_opened"

**Create trigger**

- Now give a name for the even
- I have written "lot\_Motion\_Sensor."
- Note that there should not be any blank space between the words.

Step 6:

- Now clock on **+That** button

**If**  **Then**  **That**

Step 7:

## Choose action service

Step 3 of 6

- Now from “choose action service,”
- Search for notification.
- And click on the notification icon.
- Note that you must be installed and logged in the IFTTT app on your phone for the notifications to work.

### Step 8:

- Now from here choose any of the options you need
- I am going to choose simple notification instead of rich notification.

< Back

## Choose action

Step 4 of 6

### Send a notification from the IFTTT app

This action will send a notification to your devices from the IFTTT app.

### Send a rich notification from the IFTTT app

This action will send a rich notification to your devices from the IFTTT app. Rich notifications may include a title, image, and link that opens in a browser or installed app.

### Step 9:

## Complete action fields

Step 5 of 6

Message

Motion Detected

Add ingredient

Create action

- Now in the message box write the notification which you needed to receive when the motion is detected.
- I am simply going to write “Motion Detected”
- If you have multiple sensors in place then you can write something like motion detected at garage or motion detected in closet etc..
- If you want you can give the time when the motion is detected.

Step 10:

- Now click finish

## Review and finish

Step 6 of 6

If Maker Event  
"lot\_motion\_sensor", then Send  
a notification from the IFTTT  
app

79/140

by onajad

Finish

Step 11:

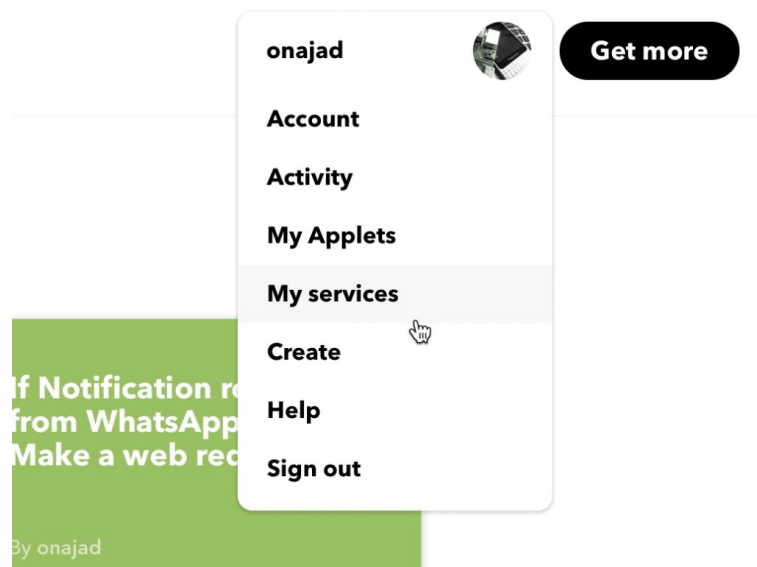

- That is, it knows we have created the applet successfully.

## Obtaining the HTTP GET request URL

Step 1:

- Log in to your IFTTT account.
- Click on your profile picture and choose My services

Step 2:

- Then select webhooks.

WU

weather underground

Webhooks

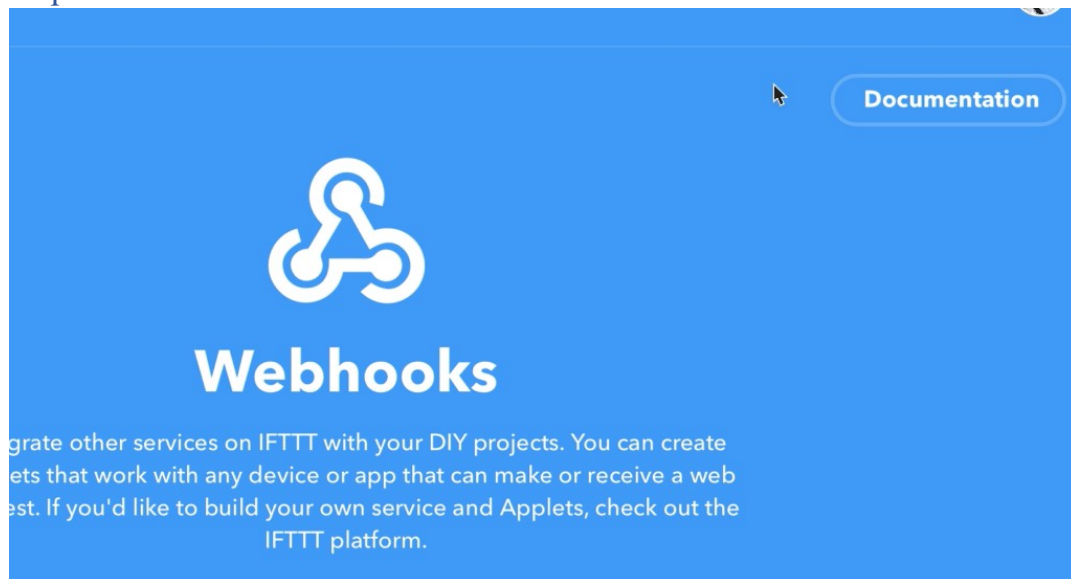

WU

weather underground

Step 3:

- Now click on Documentation

Step 4:

- Now replace **{event}** with our event name which we were given when we created our applet.
- In my case it was “Iot\_Motion\_Sensor.”
- There is a test button you can click on it to check whether your applet is working.
- Your secret key also will be on this page which you should not share with anyone. • Do not worry I have changed mine
- You can click on the image to zoom.

Your key is: **ccTStUr5ZxZPAxRuwCSdCG**

[Back to service](#)

### To trigger an Event

Make a POST or GET web request to:

```
https://maker.ifttt.com/trigger/Iot_Motion_Sensor/with/key/ccTStUr5ZxZPAxRuwCSdCG
```

With an optional JSON body of:

```
{ "value1" : "", "value2" : "", "value3" : "" }
```

The data is completely optional, and you can also pass value1, value2, and value3 as query parameters or form variables. This content will be passed on to the Action in your Recipe.

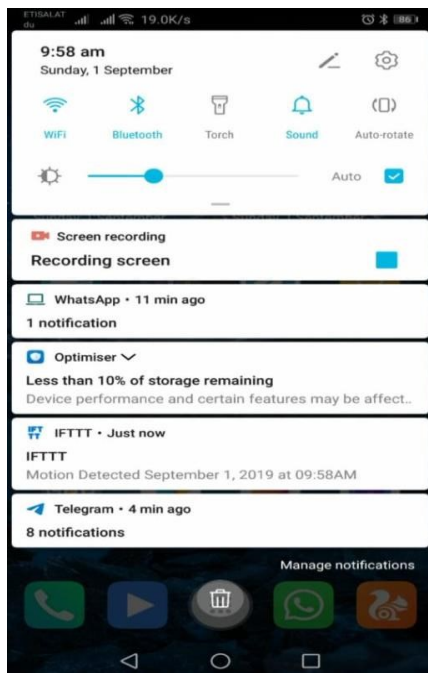

You can also try it with `curl` from a command line.

```
curl -X POST https://maker.ifttt.com/trigger/Iot_Motion_Sensor/with/key/ccTStUr5ZxZPAxRuwCSdCG
```

Test It

## Uploading and testing

- Now upload the code to your ESP8266 – 01 using an FTDI or use an Arduino as a USB to TTL converter and upload the code.
- Then connect the circuit and power it on.
- Wait for 30 seconds to calibrate the PIR sensor, when calibration is done the onboard LED will turn OFF.
- Now whenever motion is detected the onboard LED will blink and
- A push notification will arrive on your phone saying, “Motion Detected.”

## Code

```
// IoT motion sensor by www.diyusthad.com

// www.youtube.com/c/diyusthad

// www.hackser.io/najad

#include <ESP8266WiFi.h> #include

<ESP8266HTTPClient.h>

const char* ssid = "*****"; //Your Wi-Fi ssid

const char* password = "*****"; //Your WiFi password

boolean PIRstate ; //variable to store PIR state

boolean lastPIRstate = HIGH;

int PIR = 0; //PIR connected to GPIO 0

void setup () {

    WiFi.begin(ssid, password);

    while (WiFi.status() != WL_CONNECTED)

    {

        delay(1000);

    }

    pinMode(PIR, INPUT); //digitalWrite(PIR, LOW);

    pinMode(LED_BUILTIN, OUTPUT);

    delay(30000);

}

void loop()
```

```
{

  PIRstate = digitalRead(PIR);  //HIGH when motion detected, else LOW

  if (PIRstate != lastPIRstate)  //Checking if there is any motion

  {

    digitalWrite(LED_BUILTIN, LOW);

    delay(100);

    digitalWrite(LED_BUILTIN, HIGH);

    if (WiFi.status() == WL_CONNECTED)  //Check WiFi connection
status

    {

      HTTPClient http;  //Declare an object of class HTTPClient

      http.begin("paste the link from ifttt");  //Specify request
destination

      http.GET();  //Send the request

      http.end();  //Close connection

    }

    lastPIRstate = PIRstate;

  }

}
```
